

Experiment 12

Study of Camera Phishing using an Open-Source GitHub Tool in Kali Linux

■ **Important Note:** *This experiment is conducted strictly for academic and ethical purposes using consent-based simulations only. Unauthorized camera access or phishing activities are illegal and unethical.*

AIM

To study the concept of camera phishing attacks using an open-source GitHub tool in Kali Linux in order to understand privacy threats and the importance of secure user awareness.

REQUIREMENTS

Host OS	Windows / Linux / macOS
Virtualization Software	Oracle VirtualBox
Guest OS	Kali Linux 2024
Study Tool	Open-source GitHub camera phishing framework (educational use)
RAM	Minimum 4 GB (8 GB Recommended)
Disk Space	Minimum 30 GB
Processor	Intel/AMD with Virtualization support

THEORY

Camera phishing is a social-engineering-based attack where victims are tricked into granting camera access through malicious links or fake web pages. Such attacks can compromise user privacy and are commonly used in cybercrime, surveillance, and identity theft scenarios. Studying camera phishing in Kali Linux using open-source tools helps students understand how attackers exploit human behaviour rather than software vulnerabilities. This experiment focuses on awareness, detection, and prevention, not real-world exploitation.

PROCEDURE

Step 1: Start Kali Linux Virtual Machine

- Open Oracle VirtualBox.
- Start Kali Linux.
- Log in using Kali credentials.

Step 2: Study the Open-Source Tool

- Access an open-source GitHub repository related to camera phishing (educational purpose).
- Review the documentation to understand:
 - — How fake permission prompts are created
 - — How user interaction is exploited
 - — Ethical limitations of such tools

Step 3: Understand the Attack Workflow

- Analyze how phishing pages request camera permissions.
- Observe how browsers handle camera access requests.
- Study how attackers misuse user trust.

Step 4: Simulated Demonstration

- Perform a local, consent-based simulation using test accounts.
- Observe how camera permission prompts appear.
- Analyze user response behaviour.

Step 5: Analyze Security Implications

- Identify risks related to unauthorized camera access, privacy leakage, and social engineering.
- Discuss how modern browsers and OS security attempt to mitigate such attacks.

Step 6: Study Prevention Techniques

- Browser permission management
- User awareness and training
- HTTPS and trusted domains
- OS-level camera access controls

OUTPUT

- Understanding of how camera phishing attacks operate.
- Awareness of user privacy risks and social engineering techniques.
- Analysis of browser and OS-level permission controls.
- Screenshots and observations recorded for academic reference.

RESULT

The study of camera phishing using an open-source GitHub tool was successfully completed in Kali Linux. The experiment enhanced understanding of social-engineering attacks and emphasized the importance of user awareness and privacy protection. Prevention measures including browser permission management, HTTPS enforcement, and OS-level camera controls were studied and documented.
